The Photographic Atlas of the Stars contains 50, high-quality full color photographs of the entire night sky of the northern and southern hemispheres. Each plate is accompanied by a star map of the identical area, which identifies the main stars of the constituent constellations as well as other interesting astronomical objects. In addition to this detail, Sir Patrick Moore has written a commentary for each plate that highlights the stars and objects of interest to observers equipped with binoculars and that includes detailed tabular information on astronomical objects of the region. The resulting double-page spread provides an invaluable reference for the amateur astronomer, detailing the constellations and other heavenly bodies of interest that are observable with the naked eye, binoculars, or a small telescope.

A Photographic Atlas of Histology, 2e by Michael J. Leboffe is designed for use in undergraduate histology and human anatomy courses. It serves as a convenient visual reference and is of particular value to students in a laboratory setting. Commercially available microscope slides are used to photograph, so images represent the quality and diversity of what a student is actually likely to encounter in the laboratory; pathological specimens have not been used.

This atlas features photographs of actual cadaver dissections, with accompanying schematic drawings and diagnostic images. The photographs depict anatomic structures more realistically than illustrations in traditional atlases and show students what they will see in the dissection lab.
