Introduction to the ANSYS Parametric Design Language (APDL ...

APDL is the foundation for design optimization and adaptive meshing. ANSYS uses two types of parameters: scalar and array. You can use a parameter (instead of a literal number) as an argument to any ANSYS command; the parameter is evaluated and its current value is used for that argument. If the parameter name is input in a numeric argument of a command, the numeric value of the parameter is substituted into the command at that point.
