These early primates resembled present-day prosimians such as lemurs. Evolutionary changes continued in these early primates, with larger brains and eyes, and smaller muzzles being the trend. By the end of the Eocene Epoch, many of the early prosimian species went extinct due either to cooler temperatures or competition from the first monkeys.

of the early prosimian species went extinct due either to cooler temperatures or competition from the first monkeys.

## **Evolutionary Changes In Primates Answers**

They must also determine whether the fossils are from recent or ancient organisms. If a skull were discovered and determined to be a large primate skull, the next step would be to determine whether it is of an ape or a human. Because evolutionary change has occurred in both groups, the skull could be of . early or modern ape. or . early or modern human

## **Evolutionary Changes in Primates**

The primate fossil record is relatively poor, and our understanding of primate evolution (especially human evolution) changes as new information comes to light. Knowledge of primate evolution is derived through the use of fossils and biochemical methods. Fossils allow us to understand the relationships between modern and extinct primates.

## **Lab #2: Primate Evolution Flashcards | Quizlet**

Because evolutionary change has occurred in both groups, the skull could be of early or modern ape or early or modern human. Because humans and apes evolved along separate lines, certain physical characteristics can be used in an attempt to classify the fossil skull as belonging to either ape (early or modern), early human, or modern human.

## **Evolutionary Changes In Primates Lab Answers**

Bolstered concepts include that evolution is descent with modification, that evolution is a genetic process, and that humans are closely related to apes. In terms of thinking skills, the lab gives students practice with hypothetical-deductive thinking, quantifying patterns from complex data, and evaluating evidence.
