Ray resection for localized necrosis, infection, and osteomyelitis is an accepted procedure allowing removal of the diseased toe and metatarsal. The traditional approach involves a rather lengthy incision and dissection that can compromise the vascular supply to the remaining forefoot. The use of minimum incision techniques to perform metatarsal ray resection as presented here represents a simple, reliable, and easily

The skin incision is only 3mm long over the top of the foot. Using xrays to guide the burr, a small oblique section of bone is removed. No fixation is required as all the ligaments are left in place and hold the bones in position. The surgery is routine, and is performed as a daycase. Following surgery, the foot will be in a thick bandage.
