In 1968 Don moved to Indiana University as a Professor of Chemistry, where at the time he was the youngest professor in the university. UC Davis recruited him in 1978, where he remained until his retirement in 1994. Don McQuarrie's research interests were in theoretical chemistry, specifically in statistical thermodynamics of electrolyte systems and transport through membranes, stochastic differential equations, and nonlinear dynamical systems.

Statistical mechanics, one of the pillars of modern physics, describes how macroscopic observations (such as temperature and pressure) are related to microscopic parameters that fluctuate around an average. It connects thermodynamic quantities (such as heat capacity) to microscopic behavior, whereas, in classical thermodynamics, the only available option would be to measure and tabulate such ...

Using the methods developed in class: Step 1: Multiply both sides by the partition function $H = \sum_j (E_j + pV) e^{-E_j/pV}$. Step 2: Get the temperature derivative at constant (N, P) (The conjugate variable to H in this case) $\left[\frac{\partial H}{\partial T} \right]_{N,P} = - \frac{1}{kT^2} \left[\frac{\partial H}{\partial T} \right]_{N,P} = \frac{1}{kT^2} \left[\frac{\partial H}{\partial T} \right]_{N,P}$.

McQuarrie's Statistical Mechanics is a classic textbook in the field and, although it was first published in 1976, is still widely used in courses and consulted by researchers. A strong part of the appeal of the book are the numerous problems that accompany each chapter. However, no solution manual is available.

Statistical mechanics in itself can be a bit difficult to understand, but McQuarrie is one of the best authors I have come across. I'd definitely recommend this book because it really goes in depth with explaining stat mech but in such a way that you'll be able to follow!
