A visual prosthesis, often referred to as a bionic eye, is an experimental visual device intended to restore functional vision in those suffering from partial or total blindness. Many devices have been developed, usually modeled on the cochlear implant or bionic ear devices, a type of neural prosthesis in use since the mid-1980s. The idea of using electrical current to provide sight dates back to the 18th century, discussed by Benjamin Franklin, Tiberius Cavallo, and Charles LeRoy.

Visual prosthesis - Wikipedia

This bundle exits from the eye and is connected to nerve cells in the brain. Visual prostheses with a cuff electrode array having embedded electrodes in a film substrate is wrapped around optic nerves from outside as well as a type stimulating optic nerve head with wire electrodes are being proposed.

Types of Visual Prostheses | About the Technology | NIDEK ...

Such a device is known as a visual prosthesis or bionic eye and the vision created is known as artificial vision. Incidentally, RP is the leading inherited cause of blindness, with 1.5 million people affected worldwide . AMD seen in adults over 65 years is the leading cause of visual loss with 700,000 new cases diagnosed annually in the USA and 10 % of whom become legally blind each year.

The purpose of a prosthetic eye is to create a balanced facial appearance and increase comfort in the eye socket where the eye is missing. People have been making and wearing prosthetic eyes for...

Prosthetic Eye: Cost, Care, Surgery, and More

Bionic eye or bionic eye implants or visual prosthesis is an electronic device that provides a sense of eyesight to a visually impaired (partially or completely blind) person. The device is similar to cochlear implants that provide a sense of sound to people who are partially deaf or have problems related to hearing.
